National Blood Shortage Contingency Planning During a Pandemic: Hospital Transfusion Medicine Laboratory (TML) Checklist and Considerations

<u>Ge</u>

neral Blood Contingency Checklist:	
	Ensure your provincial and local emergency coordinating centres aware of the Blood Contingency plans and how they would play into pandemic activities.
	Clarify if you have different mechanisms to report as a PEBMC in the context of pandemic versus an isolated blood shortage.
	Ensure your medical leaders and clinical front line staff aware of the contingency plans and Red Phase emergency framework.
	Ensure you have the capacity for <u>sustained</u> daily inventory reporting of components by blood group.
	Ensure you have mechanisms in place to ensure compliance with Amber and Red Phase criteria.
	Ensure screening documentation tools available for your blood bank or triage staff.
	Clairify procedures for site-to-site component and product shipment in case of need for engagement of blood redistribution.
	Maximize use of alternative strategies to RBC and platelet transfusion (iron, folate, erythropoietin, thrombomimetics and tranexamic acid) O Do you need to coordinate with provincial pharmacy partners to increase stocks or change policies for access?
	Evaluate policies for patients requiring Home Infusion/Home Therapy Products which are picked up from Transfusion Medicine Laboratories (ex. SCIG, coagulation factor concentrates) O What is the currently permitted volume of product issued at one time? O Can designated individuals pick up product for patients? If so, what criteria are in place (ex. letter from the patient; presentation of the patient name and healthcare number, plus photo ID of the person picking up product, etc.) O Are there designated facilities where this product can be accessed? Should this be

- ☐ Ensure that you are aware of provincial and individual site plans for:
 - Elective surgery cancelled or ongoing?

consolidated to a single site?

- o ECMO support for intubated COVID-19 patients planned or not?
- o Stem cell and solid organ transplants criteria for when they will proceed?
- o Prophylactic Sickle Cell exchanges switch to top up RBC vs Cancel?
- o Chronic transfusion recipients/marrow failure altered thresholds? Home infusion opportunities? When would they stop prophylactic platelet transfusion? Role of preemptive alternatives now?
- o CV surgery smaller circuits? emergency cases only? enhanced preoperative anemia optimization?

Specific Blood Inventory Considerations:

Red Blood Cells (RBC):

- Is blood group testing on your essential test menu to ensure that blood banks can maximize non-O transfusion even in staffing shortages?
- Can you ensure that O negative RBC are being utilized <u>only</u> for females of childbearing potential?
- Does your facility have the ability to split/aliquot RBC units? What are implications to out-dating?
- O Where is your RBC inventory across the province?
- O What is the "red line" inventory for RBC emergency stock in all of your facilities?
- Are there opportunities for further redistribution of stock in your jurisdictions to avoid wastage?
- O When should there be a change to irradiation criteria to preserve RBC inventory?
 - Can RBC be irradiated at the time of product issue, if an on-site irradiator is available?
 - Should older units be issued to patients requiring irradiated blood?
 - Recent evidence (pending publication) suggests non-irradiated RBC units >21 days old have no viable lymphocytes.
- If extending RBC shelf life becomes necessary, is your facility able to wash (additive deplete and saline replace) RBC?

Platelets:

- Does your facility have the ability to split/aliquot platelets in your facilities? What are implications to out-dating?
- If extending platelet shelf life becomes necessary, would you have refrigerator space to accommodate cold storage of platelets?
 - It may be possible to extend platelet storage life to 10-11 days for use in the acute bleeding/trauma setting (unsuitable for prophylactic transfusion).

Plasma:

 Are any patients requiring plasma exchange at this time? What is the projected treatment course and what are considerations for alternative therapies?

Cryoprecipitate:

Does your lab have LIS codes or policies to facilitate fibrinogen concentrate use (instead
of cryoprecipitate) in your facility? Have your clinical teams been trained to administer
fibrinogen concentrate?
